Case Presentation

A 19-year-old female was referred to our institution for an incidental finding during a check-up ultrasound for nonspecific abdominal discomfort. The ultrasound showed a mixed lesion at the pancreas tail, with cystic and solid areas. The patient was asymptomatic, with no relevant laboratory anomalies and her past medical history was unremarkable. A Magnetic Resonance (MR) was performed for further evaluation. What is your diagnosis?

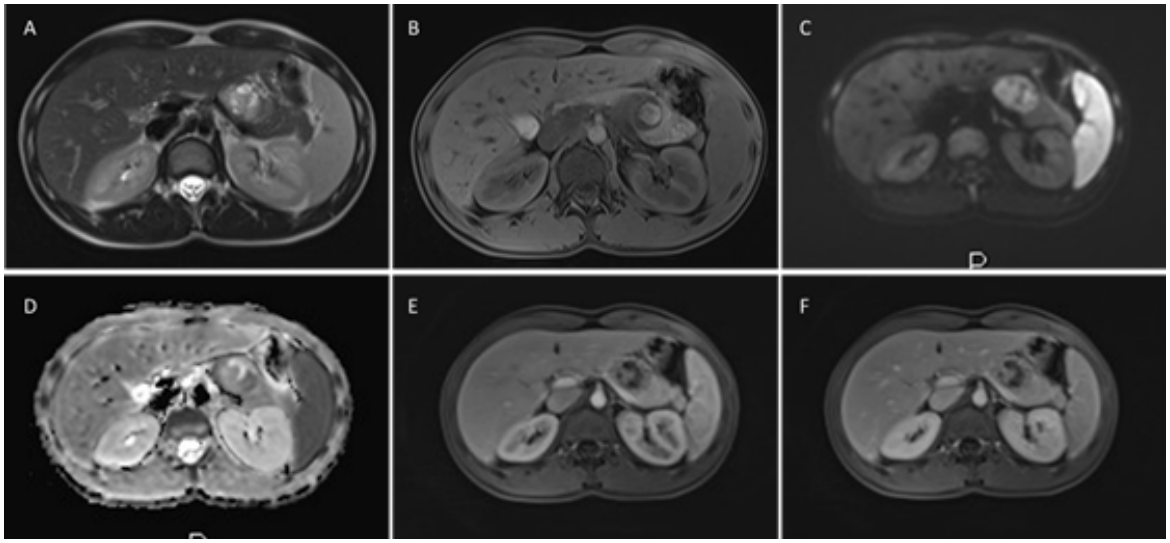

Figure 1 – Axial T2-weighted MR image (A), unenhanced fat-surpassed T1-weighted MR image (B), diffusion-weighted imaging b800 (C) and ADC map (D) MR images, contrast-enhanced fat-suppressed T1-weighted MR images in the arterial-phase (E) and delayed-phase (F).

Send your answer containing the diagnosis (s) to the email address actarp.on@gmail.com.
The names of the authors of the correct answers will be published in the next issue of the ARP in the case solution.
